

BRENTWOOD ROAD, N.E. TRANSPORTATION STUDY

MAY 2004 UPDATE

The *Brentwood Road Transportation Study* has been underway since December 2003. DDOT initiated this project to examine the transportation needs in the Brentwood Road, N.E. area, adjacent to the 9th Street Bridge.

Over past several months, two public meetings were organized to gather inputs from the citizens. During the meetings, citizens expressed a number of concerns and issues related to transportation. These concerns are being researched and any resulting recommendations will be included in the final study report.

A comprehensive field data collection scheme was undertaken. Different types of field data were collected (e.g., road geometrics, road conditions, sidewalk conditions, road sign conditions, traffic volume, travel time, parking occupancy and duration, etc.). The *Existing Condition Report* is almost completed.

The Study Team is currently examining a number of recommendations for the overall transportation system improvements. The recommendations range from simple sign/marketing refurbishment to intersection redesigns.

The study has also examined the effects of the recent 9th Street bridge closure, such as the traffic congestion along the detour routes. Mitigation measures were suggested.

STUDY AREA

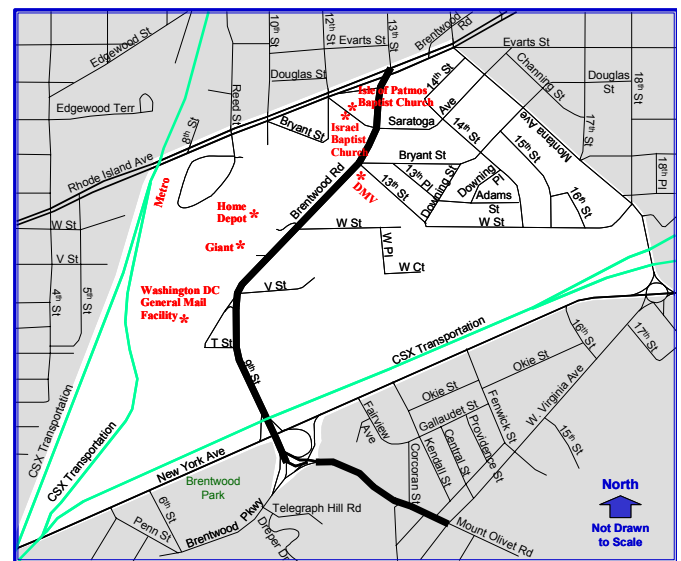

Boundaries of the study area are as follows (see map below):

North: Rhode Island Avenue

East: Montana Avenue

West: Railroad right of way

South: New York Avenue (including the 9th Street Bridge and connections with Mount Olivet Road)
